**Communication:**

- Our main source of communication will be a Discord server that we set up, and that each member is a part of. Each person should check the discord at least once per day. Every person has their own channel where they can post their progress. As the project progresses, we will also add channels that correlate to specific parts of the project.
- Important documents that everyone should be able to view and edit should be made using a Google Doc that everyone has access to.
- Talk related to a specific topic should be relegated to the specific channel that the topic is about. For example, a talk about frontend design should occur in the frontend channel.
- General talk, or important announcements, should be made in the general channel.

**Working on the Project and Expectations**

- Communication is arguably the most important part of working on this team project. If an issue arises, the person should be in contact with the rest of the team as soon as possible, so that we can adjust and adapt the plan. Every person should check the Discord as often as possible (ideally, have notifications enabled so you get a ping when something happens).
- Each class, the group will give each person "homework", or assignments that each person should try to complete by the next class. They should post their progress in their dedicated Discord channel, so that everyone can keep track of what each member is doing.

**Discourse and Disagreements**

- It's important that everyone gets a say in how the project is created. If there is a disagreement within the group in regards to handling a certain aspect of the project, everyone should be willing to discuss and debate (in a friendly manner) their solutions. If the group can't compromise and find a solution that works for everyone, we should take a vote.

- While we don't anticipate personal conflicts being an issue, it is possible that some may arise. If possible, the two team members should try to fix their issues outside of class. If that's not possible, the two should contact the professor in order to try and work towards a solution.

### **Project Organization**

- Our project has been organized into three sub-teams, each with two members. These teams are the frontend, server, and backend. Each sub-team is responsible for handling their portion of the project, and making sure that their portion is up and running in a timely manner. After each class, each group gets a "homework" assignment that should be completed before the next class.
